Interaction-Partitioned Topic Model (IPTM)

- Probabilistic model for time-stamped textual communications
- Integration of two generative models:
 - Latent Dirichlet allocation (LDA) for topic-based contents
 - Dynamic exponential random graph model (ERGM) for ties

“who communicates with whom about what, and when?”

Content Generating Process: LDA (Blei et al., 2003)

- For each topic $k = 1, \dots, K$:
 1. Topic-word distribution $\phi^{(k)} \sim \text{Dirichlet}(\beta, \mathbf{u})$
 2. Topic-IP distribution $c_k \sim \text{Uniform}(1, C)$
- For each document $d = 1, \dots, D$:

3-1. Document-topic distribution:

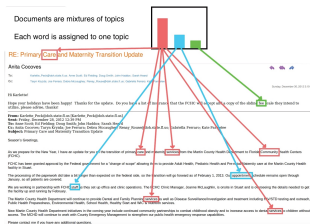

$$\boldsymbol{\theta}^{(d)} \sim \text{Dirichlet}(\alpha, \boldsymbol{m})$$

3-2. For each word in a document $n = 1$ to $N^{(d)}$:

- (a) Choose a topic $z_n^{(d)} \sim \text{Multinomial}(\theta^{(d)})$
- (b) Choose a word $w_n^{(d)} \sim \text{Multinomial}(\phi^{(z_n^{(d)})})$

3-3 Calculate the distribution of interaction patterns within a document:

$$p_c^{(d)} = \left(\sum_{k: c_k = c} N^{(k|d)} \right) / N^{(d)},$$

Dynamic Network Features (Perry and Wolfe, 2012)

- Partition the past 384 hours (=16 days) into 3 sub-intervals

$$[t - 384h, t) = [t - 384h, t - 96h) \cup [t - 96h, t - 24h) \cup [t - 24h, t),$$

then define the interval-based dynamic network statistics

- $\mathbf{x}_t^{(c)}(i, j)$ is the network statistics at time t , for interaction pattern c
 - Degree: outdegree and indegree
 - Dyadic: send and receive
 - Triadic: 2-send, 2-receive, sibling and cosibling

Tie Generating Process: Latent Edges

1. For each sender $i \in \{1, \dots, A\}$, choose a binary vector $J_i^{(d)}$ of length $(A - 1)$, by applying Gibbs measure (Fellows and Handcock, 2017)

$$P(J_i^{(d)}) = \frac{1}{Z(\delta, \log(\lambda_i^{(d)}))} \exp \left\{ \log \left(\mathbb{I} \left(\sum_{j \in \mathcal{A}_{\setminus i}} J_{ij}^{(d)} > 0 \right) \right) + \sum_{j \in \mathcal{A}_{\setminus i}} (\delta + \log(\lambda_{ij}^{(d)})) J_{ij}^{(d)} \right\},$$

where

- $\lambda_{ij}^{(d)} = \sum_{c=1}^C p_c^{(d)} \cdot \exp \left\{ \lambda_0^{(c)} + \mathbf{b}^{(c)T} \mathbf{x}_{t^{(d-1)}}^{(c)}(i, j) \right\}$ is a stochastic intensity
- δ is a real-valued intercept controlling the recipient size
- $Z(\delta, \log(\lambda_i^{(d)}))$ is the normalizing constant

i	1	2	3	4	A
1	0	1	0	1	1
2	1	0	0	0	0
...					
A	0	0	1	0	0

Tie Generating Process: Observed

- For each sender $i \in \mathcal{A}$, generate the time increments

$$\Delta T_{iJ_i} \sim \text{Exp}(\lambda_{iJ_i}^{(d)}),$$

$$\text{where } \lambda_{iJ_i}^{(d)} = \sum_{c=1}^C p_c^{(d)} \cdot \exp\left\{\lambda_0^{(c)} + \frac{1}{|J_i|} \sum_{j \in J_i} \mathbf{b}^{(c)T} \mathbf{x}_{t^{(d-1)}}^{(c)}(i, j)\right\}.$$

- Set timestamp, sender, and receivers simultaneously:

$$t^{(d)} = t^{(d-1)} + \min(\Delta T_{iJ_i})$$

$$i^{(d)} = i_{\min(\Delta T_{iJ_i})}$$

$$J^{(d)} = J_{i^{(d)}}$$

Inference - Pseudocode

- Bayesian Inference using Markov Chain Monte Carlo (MCMC)

Algorithm 1 MCMC

Set initial values $\mathcal{Z}^{(0)}, \mathcal{C}^{(0)}$, and $(\mathcal{B}^{(0)}, \delta^{(0)})$

for $o=1$ to O **do**

 Sample the latent edge $J_{ij}^{(d)}$ via Gibbs sampling

 Sample the topic assignments \mathcal{Z} via Gibbs sampling

 Sample the interaction pattern assignments \mathcal{C} via Gibbs sampling

 Sample the interaction pattern parameters \mathcal{B} via Metropolis-Hastings

 Sample the receiver size parameter δ via Metropolis-Hastings

end

Data: North Carolina Dare county email data

- $D = 1456$ emails between $A = 27$ county government managers, covering 2 month periods (October 1 - November 30) in 2013

Dare County, North Carolina

- Hurricane Sandy passed by NC: October 26 - October 30

Effect of Hurricane Sandy on Email Exchange

Pre-Sandy

Sandy

Post-Sandy

IPTM Result: Dynamic Network Effects

- IPTM result with $C = 2$, $K = 5$ and $O = 20$:

IPTM Result: Contents

- IPTM result with $C = 2$, $K = 5$ and $O = 20$:

IP	IP = 2	IP = 1	IP = 2	IP = 2	IP = 2
Topic	K=5	K=1	K= 2	K=3	K=4
Word	tim request services report tax northwest michelle evans tonnage coastal	forecast force today rip race moderate app summary operations late	updates amount mph exam machine esi view dangerous curves north	parcels billed real ocean continues watched duration early situation wash	overtime east scheduled library comp count expected human period administrative

Conclusion

- Joint modeling of ties (sender, receiver, time) and contents
- Allowance of multicast – multiple senders and/or receivers
- Possible application to various political science data
e.g. cosponsorship of bills and international sanctions
